Gas storage: 90% filling target achieved through latest auctions. As of today, Italian storage facilities—currently in the injection phase—are already at 46.5% of total filling capacity

Milan, 23 April 2026 – Following the latest auctions for the allocation of gas storage capacity for next winter, Snam announces that storage capacity allocated allowed to achieve the target of filling Italian gas storage facilities to at least 90%.

Together with the auctions already completed, the latest auctions have allowed to reach a total allocated volume of 17.5 billion cubic meters out of a total domestic storage capacity of just over 19 billion cubic meters, as the combined result of the physical availability of gas already in storage at the start of the injection season and the volumes contractually allocated.

As of today, with the filling campaign under way, the volume of gas physically present in Italian storage sites amounts to more than 46.5% of available capacity, compared with a European average of 30.6% (including Italy).
